

Nepal is a densely populated area and the most recent major earthquake took place in 2015. A tectonics team from the Earth Observatory of Singapore studies the fault that passes through the Ratu River at the feet of the Himalaya in the South East of Nepal. The goal of this research is to find out what sections of the fault are yet to break, and when this might happen again.

The Ratu River Expedition is a **25-minute** film featuring the research on Nepal earthquakes by the Structural Geology group at the Earth Observatory of Singapore, in collaboration with the Department of Mines and Geology, Nepal. The film showcases the scientific methodology used by the research team including a variety of techniques and technologies to collect data on the field for later analysis. Subtitled versions in English, Nepali, French, and Spanish.
